The N-terminal of the protein expressed by the transforming plasmid is replaced with a codon frequently used in E.coli. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The inventors claim a method of producing single-chain pro-urokinase by using as template, mRNA obtd. from cells of an established human kidhey-derived cell line. The urokinase is used treat thrombosis and embolic diseases as well as in the treatment diseases in combination with anticancer agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                           The patent is for the prodn. of human single chain urokinase-type plasminogen activator (UTPA). Mutants of scu-PA are especially those which render the protein protease resistant. Such scu-PA mutants are covalently modified at sites of proteolysis by proteases occuring in blood such as thrombin or plasmin, so that thay are no longer susceptable to protease hydrolysis at these locations. The target sites include Lys135 to Lys136 (cleavage at this site generates the so-called low modecular weight form of scu-PA or LUK), Arg156 to Phe157 (susceptible to thrombin attack) and Lys158 to Ile159 (cleavage at this site penerates tuc-PA). Suitable scu-PA mutants have site specific substitutions, insertions or deletions of residues at one or more of these target sites. Especially preferred are those mutants in which one amino acid residue or both amino acid residues is replaced by another amino acid residues or comino acid residues is replaced by another amino acid residues is replaced by another amino acid residues or comino acid residues are resistant to proteolytic attack. The UTPA proteins exhibit the biological activity of natural human UTPA without any refolding procedure being necessary. They can be used as for known and the prevention or treatment of thrombosis or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300

The Arg at position 2 is encoded by TGA(sic). Possible error in the specification. Should read CGA?
                                                The pro-UK gene was derived from plasmid pUK33. The cDNA was synthesised using urokinase mRNA isolated from a human kidney cell line. Pro-UK was cloned into a SV40 promoter-contg. plasmid 'downstream of the promoter. This plasmid was then ligated to a DHFRgene contg. plasmid so that pro-UK and DHFR are inserted in opposite directions. The recombinant plasmid was used to transform CHO-Kl cell derived DHFR gene-deficient host cells to produce glycosylated single-chain pro-UK. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A human prourokinase (PU) deriv. is new which is based upon residues 2-155 of natural human prourokinase. The new deriv. is produced by E. coli J103/pWT99/RPK in culture. It is a fast-acting drug for the treatment and prevention of thrombosis. (Updated on 25-WAR-2003 to correct PA field.) (Updated on 25-WAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                        Gaps
                     E.coli strain C600SF8 was transformed with recombinant plasmid containing ds DNA derived from human pharynx cancer cell strain petroit 562. 10000 colonies were screened and one betroit colone was identified. Plasmid pUKI was isolated and found to contain the coding region and 3' non-coding region of pro-UK downstream of Cys(H1). Four silent substitutions were identified o.f. Holmes et al., Biotechnology, vol.3, p.923 (1985) as follows: (sic) Asn(254), AAC to AAT; Leu(340), CTA to CTG; Pro(345), CCC to CCA; Gln(346), CAA to CAG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ73483 is the cDNA sequence which encodes AAR63141 the full length 54000 dalton human urokinase (UK) protein. This cDNA was used in the construction of a plasmid capable of transforming either yeast or vertebrate cells, enabling them to produce the 54000 dalton human UK protein. The UK glycoprotein produced could then be used in the treatment of cardiovascular diseases, including pulmonary embolism. The UK produced using this method had the advantage of a specific activity towards fibrin and extant thrombl, not demonstrated previously with UK isolated from natural sources.                                                                                                                                                        Sequences (AAQS5771-72) are pro-urokinase derivatives. The productive an inserted sugar moeity having an amino acid substituted, depleted or inserted variant around the thrombin cleavage site. They also have a long half-life allowing them to be used in the treatment of thrombosis.
                                                                                                                                                                                                                                                                                                                                                   0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is human plasminogen activator urokinase (u-PA), a serine protease which hydrolyses a peptide bond in human plasminogen to convert it to its active form, plasmin. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Plasmin is implicated in pericellular proteclysts associated with a wide range of physiological and pathological processes. Plasminogen activators regulate plasminogen expression either by hydrolysing a peptide bond, as in the case of u-PA, or by forming tight binding complexes with plasminogen to spontaneously convert it to plasmin. Review of sequence homologies of several plasminogen activators and chymotrypsin

This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypoptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide with plasminogen activator activity useful as thrombolytic agent for treating blood clot disorders e.g. heart attack, comprises 10 amino acid peptide fragment for recognition or activation of

The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the nonessential portions removed or truncated simplify the molecule. Such smaller proteins are cheaper and easier to produce. This sequence represents a fragment of the human urokinase protein which is used in the description of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New thrombolytic agents derived from modified humanized streptokinase,

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a procease. The inhibitor agent in a protease. The inhibitor agent in a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGF), fibroblast growth factor (FGF), connective tissue derived growth factor (FGF), connective tissue derived growth factor (FGF), ransforming growth factor (FGF), ransforming growth factor (FGF), and chrysalın. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence represents a human urpa, and is used to produce the composition of the invention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    260

```
This sequence represents single chain prepro-urokinase (sc-uph).

Pro-urokinase (amino acids 21-41) with a cleavage between amino acids 178 and 179 gives high molecular weight urokinase-type acids 178 and 179 gives high molecular weight urokinase-type plasminogen activator (HMW-uph). HWW-uph is a protein consisting of two peptide chains linked by a di-sulphide bond. The chains, and 179 of pro-urokinase- HWW-uph includes an EGF-like domain, a kringle domain and a urokinase receptor (CD87) binding domain. HWW-uph is then cleaved between amino acids 155 and 156 to give low molecular weight urokinase-type plasminogen activator (LMW-uph) (amino acids 156-178 and 179-431), that has no plasminogen activator activity. Sc-uph, or fragments of it, may be used in the anti-HIV activity. Sc-uph, or fragments of it, may be used in the anti-HIV cuph cup agents act useful for trearing HIV-infected humans for suppression of reproduction of HIV. The anti-HIV agents act by a mechanism of action different from those of conventional drugs, widening the choice of therapeutics agents and avoiding problems of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      200
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 KASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

The invention relates to a polynucleotide comprising a first nucleotide sequence (NS1) comprising a PLAU (plasminogen activator, urokinase, a serine protease) isogene selected from isogenes 1-9 and 11-20 given in the specification, where each isogene comprises the regions of the contract of the specification, where each isogene comprises the regions of the PLAU gene or CDNA and is further defined by the corresponding sequence of polymorphisms (SMP). Also included are methods of haplotyphing (and predicting that the plate of the PLAU gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLAU gene, an isolated oligonucleotide for detecting a polymorphism in the PLAU gene, a recombinant non-human organism transformed or transfected with the gene or CDNA, fragments of the polymorphism in the PLAU gene pairs encompassing a polymorphic or site, an isolated polymorphic variant PLAU protein or fragment, and isolated polymorphic variant PLAU protein or fragment, and isolated polymorphic variant PLAU a computer system for storing and analysing polymorphism data for the PLAU gene and a genome cancers. The methods are useful for treating thrombolytic disorders and cancers. The methods are useful for treating thrombolytic disorders and cancers. The methods are useful for treating thrombolytic disorders and cancers. The methods are useful for treating thrombolytic disorders and cancers. The methods are useful for improving the efficiency and cancers. The methods are useful for improving the afficiency and cancers. The methods are useful for treating thrombolytic disorders and cancers associated with PLAU activity, in validating PLAU as a drug carget and in the design of clinical trials for treating a specific condition of disease associated with PLAU activity. The antibody is

useful in diagnostic, prognostic and therapeutic methods. PLAU polynucleotides are useful in studying the expression and function of PLAU, and in expressing PLAU protein for use in screening for candidate drugs to treat diseases related to PLAU activity. The gene for PLAU is located on chromosome 10q24-qter. The present sequence represents the
                                                                                                                                9

                                                                                                                                                                                       The invention relates to a method of identifying a compound for treating cancer. The method involves detecting the expression of a panel of sequences selected from transcription factor Ets-1, urokinase-type plasminogen activator (uPA), Nacetylglucosaminyltransferase V (GnT-V), matrix-type metalloproteinase (MMP)-1 and MMP-3 in the cell. The method is useful for identifying a compound that affects a cell, particularly a cancer cell or glioma cell, or a cell that is involved in inflammation. It is used for diagnosing and/or treating cancer or other conditions that are affected by one or more members of a panel of genes or their protein product. The method is also useful for drug discovery, drug safety evaluations and in gene therapy. The present sequence is human upA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell lung cancer or other benign or precancerous lessions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, Mryersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABUS6408-ABUS6745 represent lung cancer, such as polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The

transcript in a cell from a method to detecting a contacting a patient, comprising contacting a biological sample from the patient with a polymoclectide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polymoclectides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, such as small cell lung cancer or other benign or precancerous cancer, non-small cell lung cancer or other benign or precancerous pulmonary disease, fibrosis, hypersensitivity pneumonitis, intersitial pulmonary disease, fibrosis, hypersensitivity pneumonitis, intersitial pulmonary disease, fibrosis, hypersensitivity pneumonitis, and polypeptides are useful for diagnostic purposes and as targets for and polypeptides are useful for diagnostic purposes and as targets for and polypeptides are useful for diagnostic purposes and as targets for antibuted and compounds that modulate lung cancer, such as an inceriated control or control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control control contr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ENSTDYLYPEQLKMTVVKLISHRECQQPHYYGSEVTTKMLCAADPQWKTDSCQGDSGGPL 360
                        A new compound, which is 8-50 nucleobases in length targeted to a nucleic acid molecule encoding urckinase plasminogen activator, specifically hybridises with and inhibits the expression of urckinase plasminogen activator. The compound is useful for preparing a composition for treating (e.g. by gene therapy) hyperproliferative disorder, cancer e.g., breast, colon, bone, brain, ovary, cervix, endometrium, stomach or kidney cancer, or tumour metastasis. This is the amino acid sequence of a urckinase plasminogen activator.
                                                                                                                                                                                                                                                                                                         KASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK
                                                                                                                                                                                                                                                                                                                                    KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK

                                                                                                                                                                  way as PUK, e.g. for treating acute myocardial infarction, lung embolism and deep venous thrombosis. It has greater affinity for plasminogen bound to fibrin than for circulating plasminogen, so have high selectivity for thrombi with reduced chance of bleeding. Compared with the COOH-terminated cpds., it has a better stability sea of the cookypeptidases and prolonged half life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The protein has fibrinolytic activity and can be used in the same way as PUK, e.g. for treating acute myocardial infarction, lung embolism and deep venous thrombosis. It has greater affinity for plasminogen bound to fibrin than for circulating plasminogen, so have high selectivity for thrombi with reduced chance of bleeding. Compared with the COOH-terminated cpds., it has a better stability against most carboxypeptidases and prolonged half life.

/note= "deleted in modified urokinase of the invention"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the full length urokinase, including the whey acid protein (WAP) signal peptide. This sequence has residues 179-184 of the urokinase sequence deleted to create the modified urokinase of the invention. The modified urokinase (see AAW2459) cleaves plasminogen, and has a lower binding affinity for plasminogen activator inhibitor-1 than the corresponding unmodified urokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Deletion-modified urokinase protein - with increased resistance to inhibition by plasminogen activator inhibitor-1
                                                                                                                   361 VCSLQGRMTLTGIVSWGRGCALKDKPGVYTRVSHFLPWIRSHTKEENGLAL 411

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The protein has fibrinolytic activity and can be used in the same way as PUK, e.g. for treating acute myocardial infarction, lung embolism and deep venous thrombosis. It has greater affinity for plasminogen bound to fibrin than for circulating plasminogen, so have high selectivity for thrombi with reduced chance of bleeding. Compared with the COOH-terminated cpds., it has a better stability against most carboxypeptidases and prolonged half life.

A low mol. wt. polypeptide plasminogen activator (PA) is claimed which is formed from amino acids 150-411 of prourokinase. The preferred intiation region for the low mol. wt. PA is indicated (see FT). A low mol wt. PA can be injected into blood in the body in vivo to dissolve clots without harm.

Urokinase is one of two types of mammalian plasminogen activators (PA), the other being tissue type PA. PAs catalyse the conversion of the circulating zymogen plasminogen to the broad spectrum protease plasmin by limited proteolysis. The modified urokinase can be used for clot lysis, specifically to dissolve heart attack-causing clots before they cause permanent damage to heart muscle. The urokinase mutant is more resistant to inhibition by plasminogen activator inhibitors than the unmodified urokinase. It can be selectively expressed and secreted from the mammary glands of transgenic animals.

myocardial infarction.

DNA encoding the protein was sequenced from plasmid pCGE195, a subclone of two inserts isolated by screening a cDNA library prepd. from kidney cell RNA. One of the original inserts, clone CGF31 (tag o: started in the middle of the signal sequence. Mutants of the sequence, pref. in which gcc (Ala) replaces aat (Asn) at nucleotides 1002-1004 (residue 302) are used to transform hosts for the prodn. of non-glycosylated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 KASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDNRRRPWCYVQVGLK 120

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Title: The chicken urokinase-type plasminogen activator gene.
A.Rccession: A35005
A.Fitle: The chicken urokinase-type plasminogen activator gene.
A.Rccession: A35005
A.Status: preliminary
A.Residues: 1-434 cLES
A.Ccession: A35005
C.Superfamily: urokinase-type plasminogen activator, EGF homology; kringle homology; A;Rcsidues: 1-434 cLES

C;Comment: Cleavage by plasmin or trypsin produces two chains held together by a singl
C;Comment: t-PA converts plasminogen to plasmin by hydrolyzing a single Arg-Val bond.
C;Comment: t-PA binds chain A of fibrin by kringle 2 and the fibronectin type I repeat
C;Gemetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A,Cross-references: GB:M18182; NID:g340176; PIDN:AAA36800.1; PID:g340177
